

**SYSTEM AND METHOD FOR PROVIDING FEEDBACK TO AN
INDIVIDUAL PATIENT FOR AUTOMATED
REMOTE PATIENT CARE**

Abstract

5 A system for providing feedback to an individual patient for automated
remote patient care is presented. A medical device adapted to be implanted for a
patient collects and regularly records a device measures set containing individual
device measures. A remote client processes voice feedback into a set of quality of
life measures relating to patient self-assessment indicators. A database collects
10 the identified collected device measures set, and the quality of life measures set
into a patient care record. A server periodically receives the identified collected
device measures set and the quality of life measures set from the medical device
and the remote client, and analyzes the identified collected device measures set,
the quality of life measures set, and the collected device measures sets in the
15 patient care record for the individual patient relative to other collected device
measures sets stored in the database to determine a patient status indicator.
